WHAT RESEARCHERS HAVE FOUND

Anxiolytic Efficacy Comparable to Benzodiazepines

Russian clinical trials demonstrated that Selank produces anxiolytic effects comparable to medazepam in patients with generalized anxiety disorder, without the sedation, amnesia, or dependence associated with benzodiazepines.

Institute of Molecular Genetics, Russian Academy of Sciences, 2014

BDNF Expression and Neuroprotection

Research indicates Selank elevates Brain-Derived Neurotrophic Factor (BDNF) expression in the hippocampus, supporting neuroplasticity, memory formation, and neuroprotective effects under stress conditions.

Psychopharmacology Research, 2017

GABAergic Modulation Without Dependence

Selank acts as an allosteric modulator of GABA-A receptors, enhancing inhibitory neurotransmission without directly binding the benzodiazepine site — eliminating the risk of tolerance, withdrawal, and cognitive impairment.

Journal of Peptide Science, 2016
